LedgerPilot AI

Start-up guide for Windows: from the project folder to a live demo and a submitted entry. No Linux needed on your PC.

Hackathon	AMD Developer Hackathon: ACT III · track: Evolus Business Agents on AMD
Deadline	Saturday 17 October 2026, 17:00 UTC (22:00 in Pakistan)
Project folder	C:\Users\madinapc\Pictures\New folder\ledgerpilot001-ai\ledgerpilot-ai

How to use this guide

Do the parts in order. Each grey box is a command: copy **one line at a time** into PowerShell and press Enter.

Text in angle brackets, like `<DROPLET_IP>`, means **put your own value there**, without the brackets.

If a command prints red error text, copy all of it and paste it to Claude.

The parts

Part	What you do	Rough time
1	Open the project folder and PowerShell	5 min
2	Try the app on your PC without any keys	10 min
3	Start the AI model on AMD Developer Cloud	30-45 min
4	Set up the Evolus workspace	30 min
5	Write your settings file (.env)	10 min
6	Live checks and results	30-60 min
7	Run the app and rehearse the demo	15 min
8	Publish on GitHub and submit	45 min

The big picture

Three pieces work together. Your PC only runs the app; the AI model runs on a rented AMD GPU in the cloud, which you control from PowerShell.

```
Your Windows PC                    AMD Developer Cloud (Linux, MI300X GPU)
  LedgerPilot app  ---------->     vLLM serving Qwen2.5-32B on port 8000
        |                                  ^
        v                                  |
  Evolus workspace (website) -------------+  the Evolus agent calls your model
```

> **Tip:** Your RX 9060 XT is not needed. The hackathon rules ask for the model on AMD Developer Cloud, and the 32B model needs about 64 GB of GPU memory.

Files you will open

File (inside the project folder)	What it is	Open with
.env.example	Template for your settings. You copy it to .env.	(copied in Part 5)
.env	Your keys and IDs. Never share or upload it.	Notepad
docs\evolus_setup.md	Exact Evolus setup, with the extractor fields to copy	Notepad
src\ledgerpilot\agent_client.py	Lines 21-36: the agent instructions to paste into Evolus	Notepad
docs\evaluation.md	Your measured results (created in Part 6)	Notepad
docs\benchmark.md	AMD speed and cost results (created in Part 6)	Notepad
docs\submission\CHECKLIST.md	Final submission checklist	Notepad
docs\submission\video_script.md	What to say and show in the video	Notepad
docs\submission\descriptions.md	Text to paste into the submission form	Notepad
docs\submission\cover.png	Cover image for the submission (1920x1080)	Photos
app.py	The app itself. You don't need to edit it.	-

To open a file in Notepad from PowerShell, type `notepad` and the file name, for example `notepad docs\evolus_setup.md`.

Part 1 · Open the project and PowerShell

1. Open **File Explorer** and go to the project folder:

```
C:\Users\madinapc\Pictures\New folder\ledgerpilot001-ai\ledgerpilot-ai
```

Got the project as **ledgerpilot-ai.zip** instead? Right-click it, choose **Extract All**, and open the `ledgerpilot-ai` folder inside.

2. Click the **address bar** at the top of the File Explorer window, type `powershell` and press Enter. A blue or black PowerShell window opens, already in the project folder.

3. Check you are in the right place:

```
dir
```

> **You should see:** a list that includes `app.py`, `README.md`, `requirements.txt` and the folders `docs`, `scripts` and `src`.

Part 2 · Try it on your PC (no keys needed)

On **this** PC the Python environment (the `.venv` folder) already exists: skip to step 3. On a new PC, do steps 1 and 2 once.

1. Install Python 3.11, then **close PowerShell and open it again** in the project folder (Part 1):

```
winget install Python.Python.3.11
```

2. Create the environment and install the libraries (takes a few minutes):

```
py -3.11 -m venv .venv
.\.venv\Scripts\python.exe -m pip install -r requirements.txt
```

3. Run the automatic tests (about one minute):

```
.\.venv\Scripts\python.exe -m pytest -q
```

> **You should see:** a last line like `208 passed, 1 skipped`.

4. Start the app:

```
.\.venv\Scripts\python.exe -m streamlit run app.py
```

> **You should see:** your browser opens http://localhost:8501 with the LedgerPilot page. Yellow warnings in the left sidebar are normal: there are no keys yet.

5. To stop the app, click the PowerShell window and press **Ctrl+C**.

Part 3 · Start the AI model on AMD Developer Cloud

You rent one AMD Instinct MI300X GPU machine (a "droplet") and start the model on it. Menu names on the website may differ slightly from the ones below.

3.1 Make an SSH key (once)

1. In PowerShell, run this and press Enter at every question:

```
ssh-keygen -t ed25519
```

2. Show your public key, then select and copy the whole line that starts with `ssh-ed25519`:

```
type $env:USERPROFILE\.ssh\id_ed25519.pub
```

3.2 Create the droplet (in your browser)

1. Sign in to **AMD Developer Cloud** with your hackathon account.

2. Create a **GPU droplet**: choose **1x MI300X** and the **vLLM** (Quick Start) image.

3. Add the SSH key you copied, then create the droplet.

4. Copy its **public IP address**. This guide calls it `<DROPLET_IP>`.

> **Careful:** The droplet costs money every hour it exists, even when powered off. Delete it after judging.

3.3 Start the model

1. Connect from PowerShell (type `yes` the first time it asks):

```
ssh root@<DROPLET_IP>
```

2. You are now on the cloud machine. Run these lines one at a time:

```
docker exec -it rocm /bin/bash
export VLLM_API_KEY=$(openssl rand -hex 32); echo $VLLM_API_KEY
```

> **Careful:** The long code printed by `echo` is your **VLLM_API_KEY**. Copy it into Notepad now; you need it in Parts 3, 4 and 5. Keep it secret.

3. Start the model server. Paste the whole block at once (it is one command):

```
nohup python -m vllm.entrypoints.openai.api_server \
  --model Qwen/Qwen2.5-32B-Instruct --served-model-name ledgerpilot-model \
  --host 0.0.0.0 --port 8000 --dtype float16 --max-model-len 32768 \
  --api-key $VLLM_API_KEY --enable-auto-tool-choice --tool-call-parser hermes \
  > /tmp/vllm.log 2>&1 &
```

4. Watch it load. The first start downloads the model and can take 10-20 minutes:

```
tail -f /tmp/vllm.log
```

> **You should see:** a line with `Application startup complete`. Then press **Ctrl+C** (the server keeps running), and type `exit` and Enter twice to return to Windows.

3.4 Check it from Windows

1. In PowerShell on your PC (one line):

```
curl.exe http://<DROPLET_IP>:8000/v1/models -H "Authorization: Bearer <VLLM_API_KEY>"
```

You should see: text that contains `ledgerpilot-model`. If it hangs or times out, allow inbound **TCP port 8000** in the droplet's firewall or networking settings and try again.

Part 4 · Set up the Evolus workspace

Everything here happens on the Evolus website, in the **event workspace** from the hackathon link. The full details, including the exact fields for each extractor, are in a file:

```
notepad docs\evolus_setup.md
```

Keep a Notepad page open and write down every ID as you go. You need them all in Part 5.

#	In Evolus	What to enter	Write down
1	Your models › add an OpenAI-compatible model	Base URL `http://<DROPLET_IP>:8000/v1` · Model name `ledgerpilot-model` · API key = your VLLM_API_KEY. Click **Test connection**.	-
2	Create an agent named LedgerPilot Clerk	Model: the one from row 1. Instructions: the text of lines 21-36 of `src\ledgerpilot\agent_client.py` (between the triple quotes). Temperature 0 to 0.2.	Agent ID
3	Create 3 document extractors (JSON output)	Invoice, Purchase order, Goods-received note. Copy each field list from `evolus_setup.md` exactly.	3 extractor IDs
4	Create a knowledge library: Vendor master and AP policy	Leave it empty for now (Part 6 uploads to it). Attach it to the agent.	Library ID
5	Create a workflow: Exception routing	As in `evolus_setup.md` section 5, with the 5 parameters. **Switch it on.**	Workflow ID
6	API keys page	Create an API key.	API key and space (app) ID

Tip: To open the agent instructions: `notepad src\ledgerpilot\agent_client.py`, then copy from the line after `AGENT_INSTRUCTIONS = """` down to the closing `"""`.

Part 5 · Write your settings file (.env)

1. In PowerShell, in the project folder, copy the template and open it:

```
copy .env.example .env
notepad .env
```

2. Fill in each value after the = sign, with no spaces or quotes:

Setting	Where it comes from
VLLM_BASE_URL	`http://<DROPLET_IP>:8000/v1` (your droplet's IP)
VLLM_API_KEY	The code printed by `echo $VLLM_API_KEY` in Part 3
VLLM_MODEL	Leave as `ledgerpilot-model`
EVOLUS_API_KEY	Part 4, row 6
EVOLUS_APP_ID	Part 4, row 6 (the space ID)
EVOLUS_AGENT_ID	Part 4, row 2
EVOLUS_EXTRACTOR_AGENT_ID	Leave empty unless the extractors belong to another agent
EVOLUS_EXTRACTOR_INVOICE_ID, _PO_ID, _GRN_ID	Part 4, row 3
EVOLUS_WORKFLOW_ID	Part 4, row 5
EVOLUS_LIBRARY_ID	Part 4, row 4
PRICE_TOLERANCE, MAX_TAX_RATE, timeouts	Leave as they are

3. Save (**Ctrl+S**) and close Notepad. Check the file name is exactly `.env`:

```
dir .env
```

> **Careful:** If you see `.env.txt` instead, rename it: `ren .env.txt .env`. Never email, upload or commit `.env`; the project already tells Git to ignore it.

Part 6 · Live checks and results

Run these one at a time, in this order, in the project folder. Keep each window's output: you will paste all four to Claude.

1. Upload the vendor master to your Evolus library:

```
.\.venv\Scripts\python.exe scripts\upload_library.py
```

2. The go/no-go check:

```
.\.venv\Scripts\python.exe scripts\smoke_test.py
```

> **You should see:** five lines starting with `PASS`, then `ALL GOOD`. If any line says `FAIL`, stop and paste it to Claude.

3. The full evaluation on all 24 sample invoices (several minutes, uses Evolus credits):

```
.\.venv\Scripts\python.exe eval\run_eval.py --label "Qwen2.5-32B"
```

> **You should see:** one line per case ending in `OK` or `MISS`, then a summary. It creates `docs\evaluation.md` and the demo recordings in `data\recordings`.

4. The AMD speed and cost benchmark (put your real price per GPU-hour):

```
.\.venv\Scripts\python.exe scripts\benchmark_amd.py --label "Qwen2.5-32B" --gpu-price <PRICE>
```

> **You should see:** `wrote docs/benchmark.md` at the end.

5. Paste all four outputs to Claude. Claude fills the real numbers into the README, slides, video script and descriptions.

Part 7 · Run the app and rehearse the demo

1. Start the app:

```
.\.venv\Scripts\python.exe -m streamlit run app.py
```

> **You should see:** green boxes in the sidebar (AMD model online, Evolus connected) and, under the title, **Model: Qwen/Qwen2.5-32B-Instruct served on AMD Developer Cloud**.

2. In the sidebar, click **Clear demo history**. Do this before every rehearsal, or re-checked invoices are flagged as duplicates.

3. Click the three demo buttons at the top of the page, one at a time:

Button	Expected stamp	What to point at
Clean invoice (case 01)	READY TO PAY	High confidence; still waits for a person
Overcharged by $200 (case 07)	ON HOLD	PRICE_VARIANCE, $200 at risk, draft email
Bank account changed (case 15)	PAYMENT BLOCKED	BANK_MISMATCH, masked account, alert

4. Click **Measure model speed** in the sidebar to show tokens per second from the AMD GPU.

5. If the live services are slow on demo day, use demo mode (it replays your recorded live runs and says so on screen). Turn on the sidebar switch, or open:

```
http://localhost:8501/?demo=1
```

6. Stop the app with **Ctrl+C** in PowerShell.

Part 8 · Publish on GitHub and submit

8.1 Put the code on GitHub

1. On github.com: **New repository**, name `ledgerpilot-ai`, choose **Public**, do **not** add a README, then **Create repository**.

2. In PowerShell, in the project folder. First check that `.env` is **not** listed:

```
git status
```

3. Save the results from Part 6 and send everything to GitHub (a sign-in window opens the first time):

```
git add -A
git commit -m "Add live evaluation and benchmark results"
git remote add origin https://github.com/<YOUR_USERNAME>/ledgerpilot-ai.git
git push -u origin main
```

> **You should see:** on the GitHub page, your files. Open the **Actions** tab: the **tests** and **docker** checks should turn green within a few minutes.

8.2 Finish the assets

Asset	Where	What to do
Video (about 3 min)	docs\submission\video_script.md	Record the app with the Windows Clipchamp app or OBS, following the script
Slides	https://claude.ai/artifact/2vxKrSchwmdFbRVzyaytPH	Fill the [__] numbers, then Share › Export as PDF
Cover image	docs\submission\cover.png	Upload as the project image
Descriptions and tags	docs\submission\descriptions.md	Copy into the form

8.3 Submit

1. On lablab.ai, open the AMD Developer Hackathon: ACT III page and submit to the track **Evolus Business Agents on AMD**.

2. Add: GitHub link, video, slides PDF, cover image, short and long description, tags.

3. Go through docs\submission\CHECKLIST.md once more, then open your submission and test every link.

4. After judging, **delete the droplet** in AMD Developer Cloud so it stops costing money.

If something goes wrong

What you see	What to do
`python` or `py` is not recognized	Close PowerShell and open it again in the project folder. Always start commands with `.\.venv\Scripts\python.exe`.
`git` is not recognized	Close PowerShell and open it again (Git was installed recently).
Git says Please tell me who you are	Run `git config --global user.name "Your Name"` and `git config --global user.email "you@example.com"`, then commit again.
The app says settings are missing	Check `dir .env` shows `.env` (not .env.txt) and that every value in Part 5 is filled in. Restart the app after editing .env.
The curl check in Part 3 hangs	Open TCP port 8000 in the droplet firewall. Check the log on the droplet: `ssh root@<DROPLET_IP>`, then `docker exec -it rocm tail -n 50 /tmp/vllm.log`.
Smoke test: FAIL on the AMD endpoint	The droplet may be off, or VLLM_BASE_URL / VLLM_API_KEY are wrong. Redo the Part 3.4 check.
Evolus rejected the API key (401/403)	Check EVOLUS_API_KEY and EVOLUS_APP_ID.
Evolus credits are used up (402)	Ask the hackathon organisers for more credits.
Workflow is switched off (409)	Switch the workflow on in Evolus.
Re-checked invoices show PAYMENT BLOCKED as duplicates	Click Clear demo history in the sidebar first.
The app page is blank or stuck	Press Ctrl+C in PowerShell, start the app again, refresh the browser.
Anything else	Copy the whole error text and paste it to Claude.

Every command in one place

```
cd 'C:\Users\madinapc\Pictures\New folder\ledgerpilot001-ai\ledgerpilot-ai'
.\.venv\Scripts\python.exe -m pytest -q
copy .env.example .env
notepad .env
.\.venv\Scripts\python.exe scripts\upload_library.py
.\.venv\Scripts\python.exe scripts\smoke_test.py
.\.venv\Scripts\python.exe eval\run_eval.py --label "Qwen2.5-32B"
.\.venv\Scripts\python.exe scripts\benchmark_amd.py --label "Qwen2.5-32B" --gpu-price <PRICE>
.\.venv\Scripts\python.exe -m streamlit run app.py
git add -A
git commit -m "Add live evaluation and benchmark results"
git push
```
